

MORTONII DESTRUCTUS

A newly introduced species, *Mortonii destructus*, bears watching. Benefactor to a select few, ecological disaster to most.

Life History: Very limited in its ability to adapt. Occupies an extremely narrow niche but often goes unnoticed with disastrous results.

Diet: Very secretive about its requirements. Anecdotal evidence* indicates that \$\$ from unidentified sources and companies such as Spray Lakes Sawmills, is a likely mainstay.

Life Cycle: In this developmental phase, a life cycle is complete after 4 years. However, a mutation may occur which can extend the cycle for another 4 years which would extend its destructive potential.

Behaviour: Its destructive power stems from the ability to influence otherwise rational creatures to engage in self-destructive actions.

Control Measures: High concentration application of any of the following; common sense, honesty, logic, science, reality, accountability.
